Declines of Native Salmonids

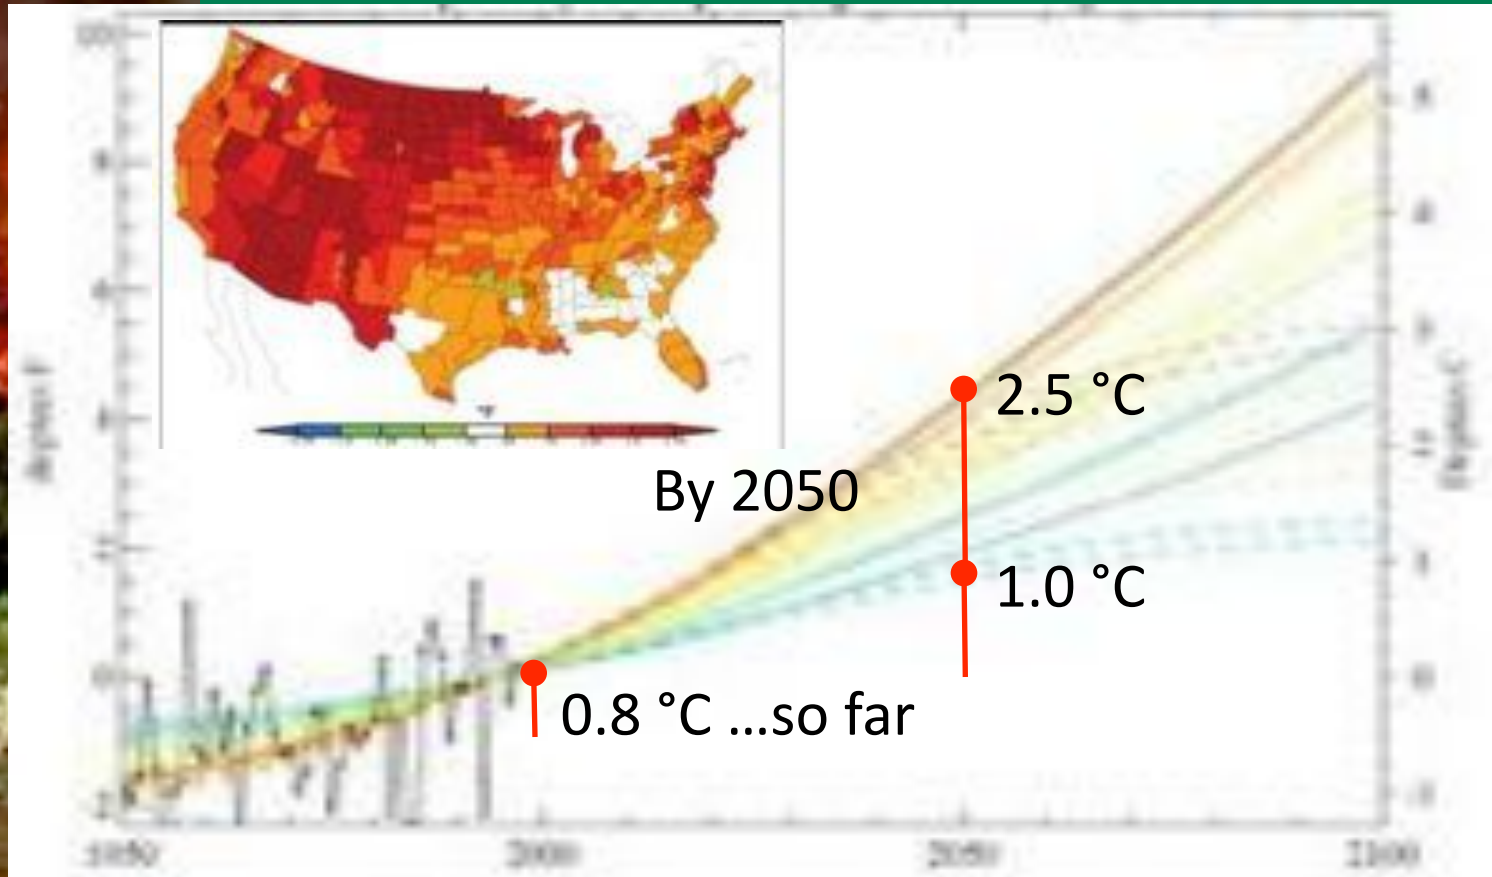

Habitat alteration

Invasive species

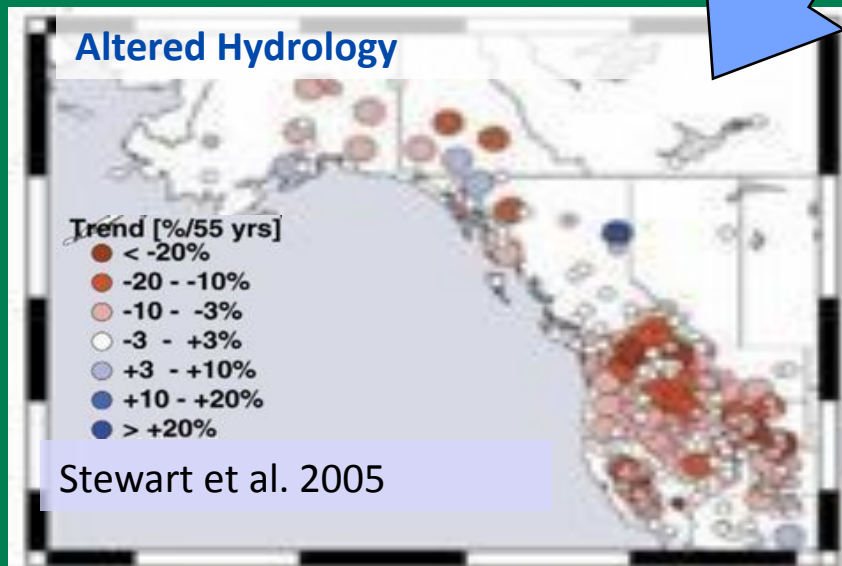

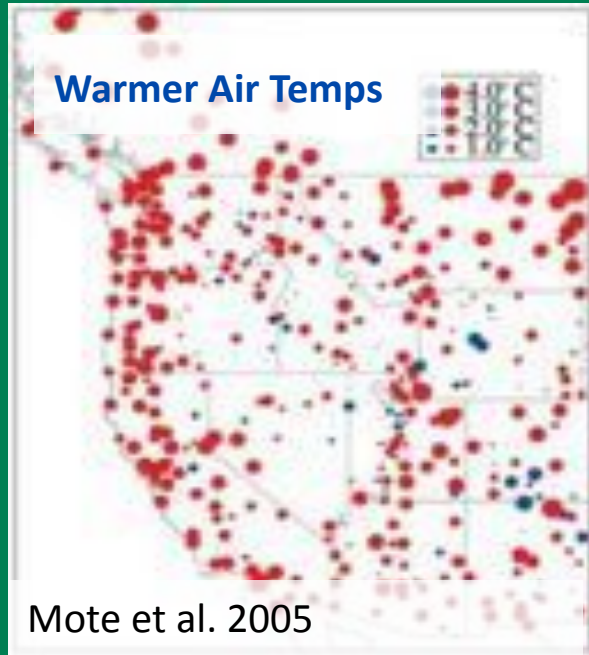

Climate is Changing Fastest in the Interior West

A Landscape Undergoing Change

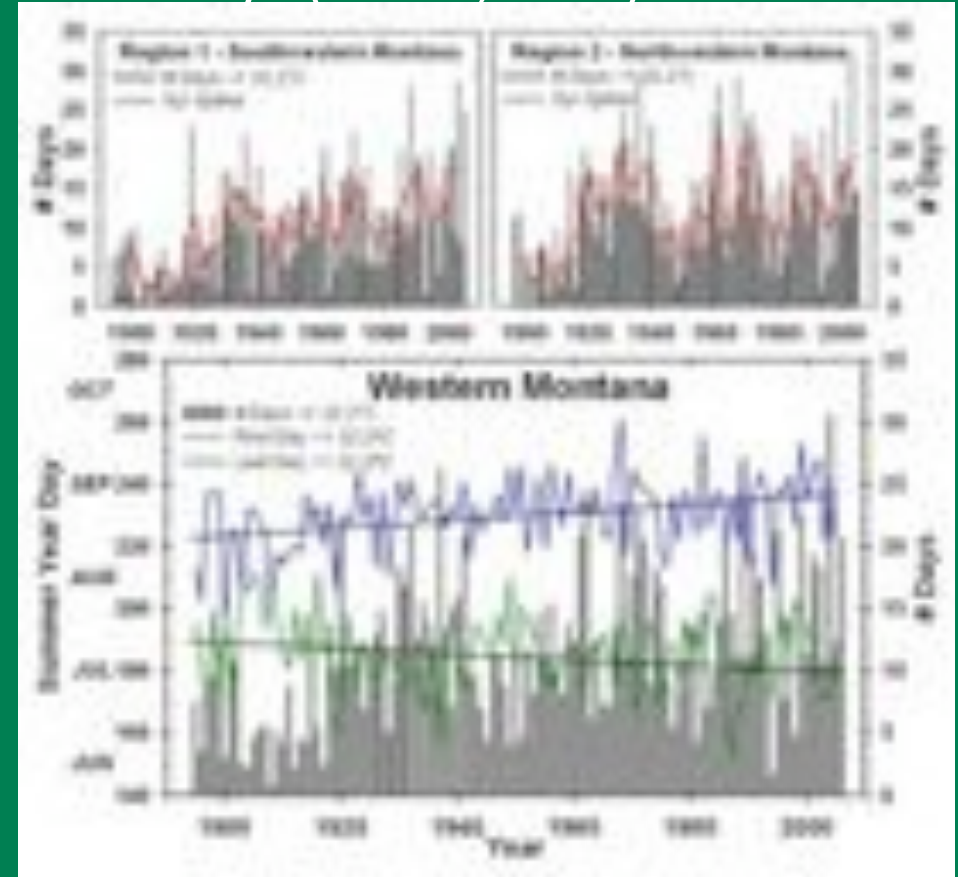

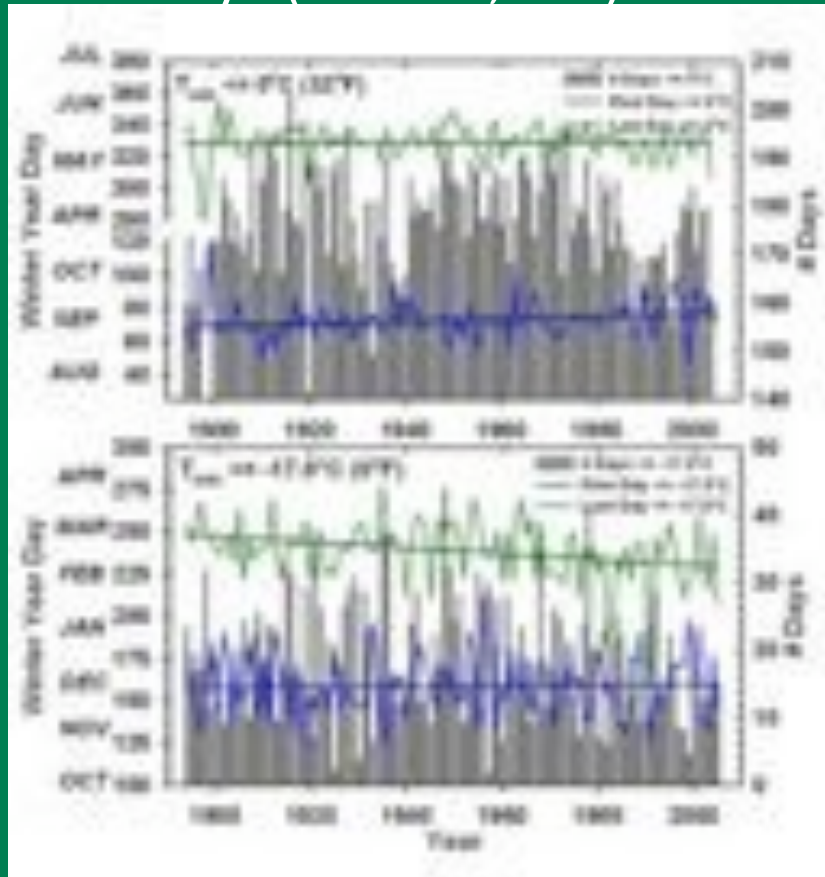

Western US – Observed Trends

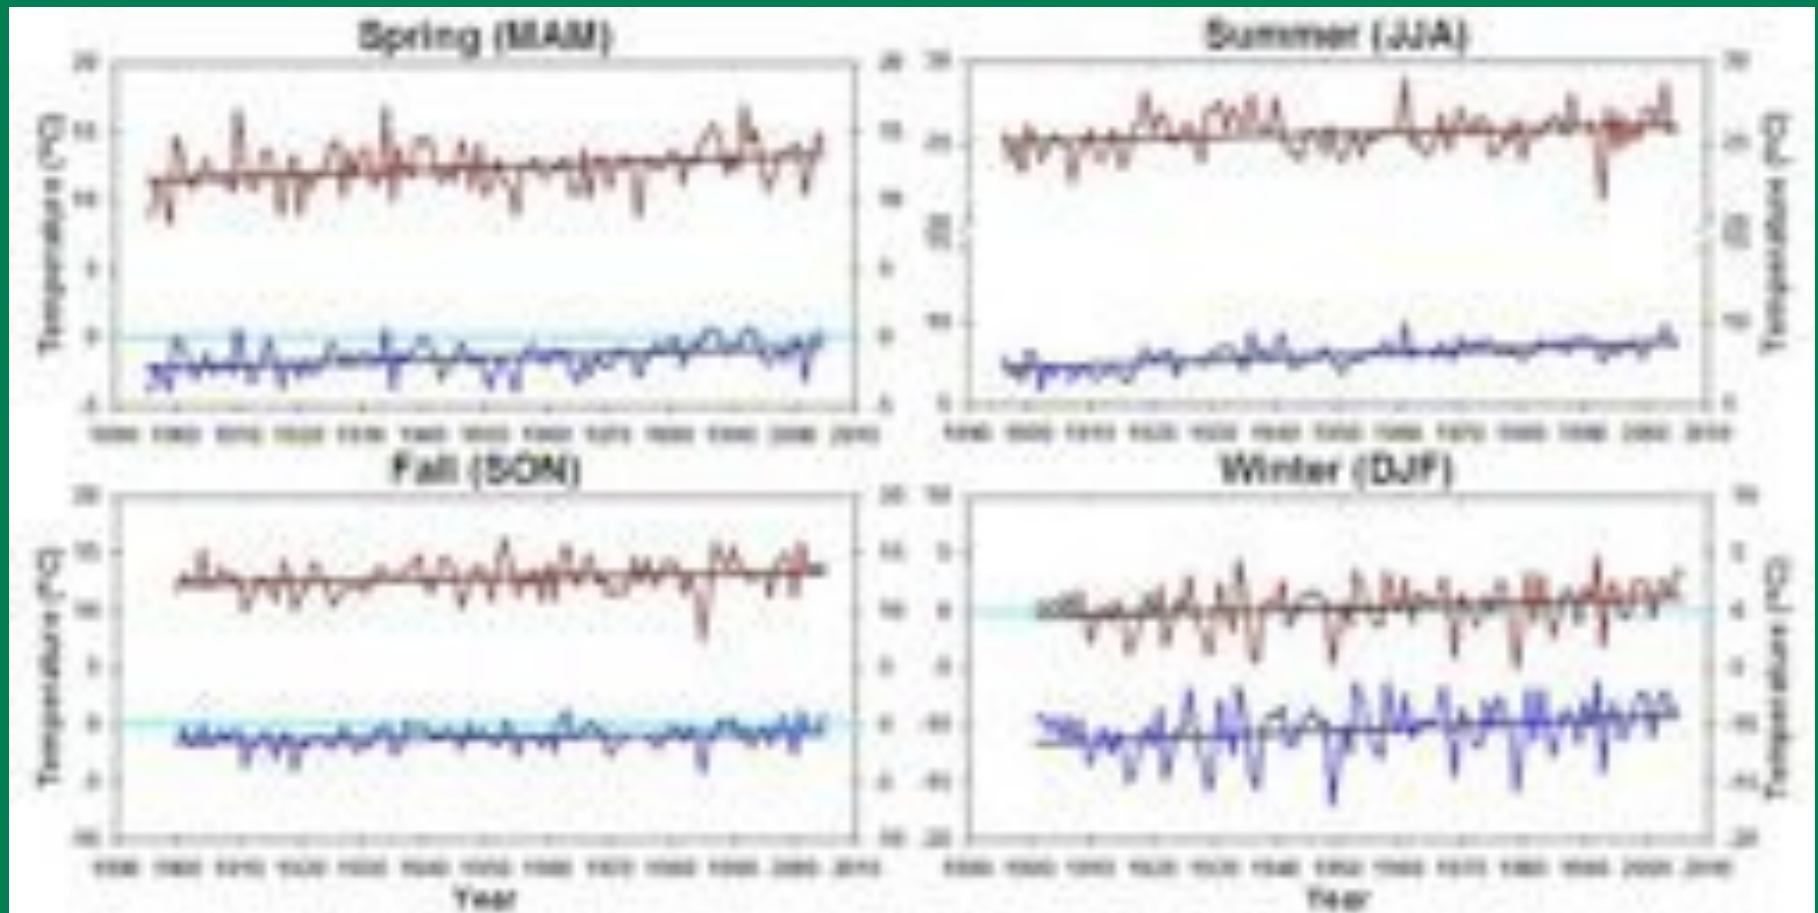

Air Temperature Trends – Western Montana

Loss of ~ month of extremely cold days ($< -18^{\circ}\text{C}$; 0°F)

3-fold increase in extremely hot days ($>32^{\circ}\text{C}$; 90°F)

Air Temperature Trends – Western Montana

1900-2006

- **+1.33°C** rise in annual average temperatures
- **~1.8 times > +0.74°C** rise in **Global temperatures**

Phase I: Broad-scale analysis of climate change and native trout persistence

- What kinds of climate associated stressors are likely to pose the greatest risk for native trout?
- Where are the highest risk impacts likely to occur?
- Where are the lowest risk areas?
- How do these climate-associated stressors interact with existing population status and habitat condition?

Focal species

Haak et al. *In-review*

Increased summer temperatures

Used trout historic distribution to define suitable temperatures for each fish based on PRISM temperature data

Applied 3°C increase to PRISM data

Categorized risk

Drought

Hoerling and Eischeid (2007) applied the Palmer Drought Severity Index to project drought 2035-2060

PDSI developed for plains states: does not capture the regional microclimates associated with mountainous terrain in the West

Used elevation (snowpack) and mean annual precipitation to mitigate

Williams et al. 2009

Uncharacteristic flooding

Areas transitioning from snow to rain experiencing uncharacteristic flooding events in west

Followed Hamlet and Lettenmaier (2007) to categorize basins as:

- Snow dominant
- Rain dominant
- Transient

Applied 3° C increase and re-categorized

Williams et al. 2009

Increased risk of fire

- Westerling et al (2006) found fires in west associated with timing of snow melt
- Earlier melt = more fires/ longer season due to increased drying
- Topographic zone of 1680 – 2690 m
- Within topographic zone, further classified based on fuel types using Anderson Fire Behavior Fuel Model (Anderson 1982)

Composite Climate Change Risk

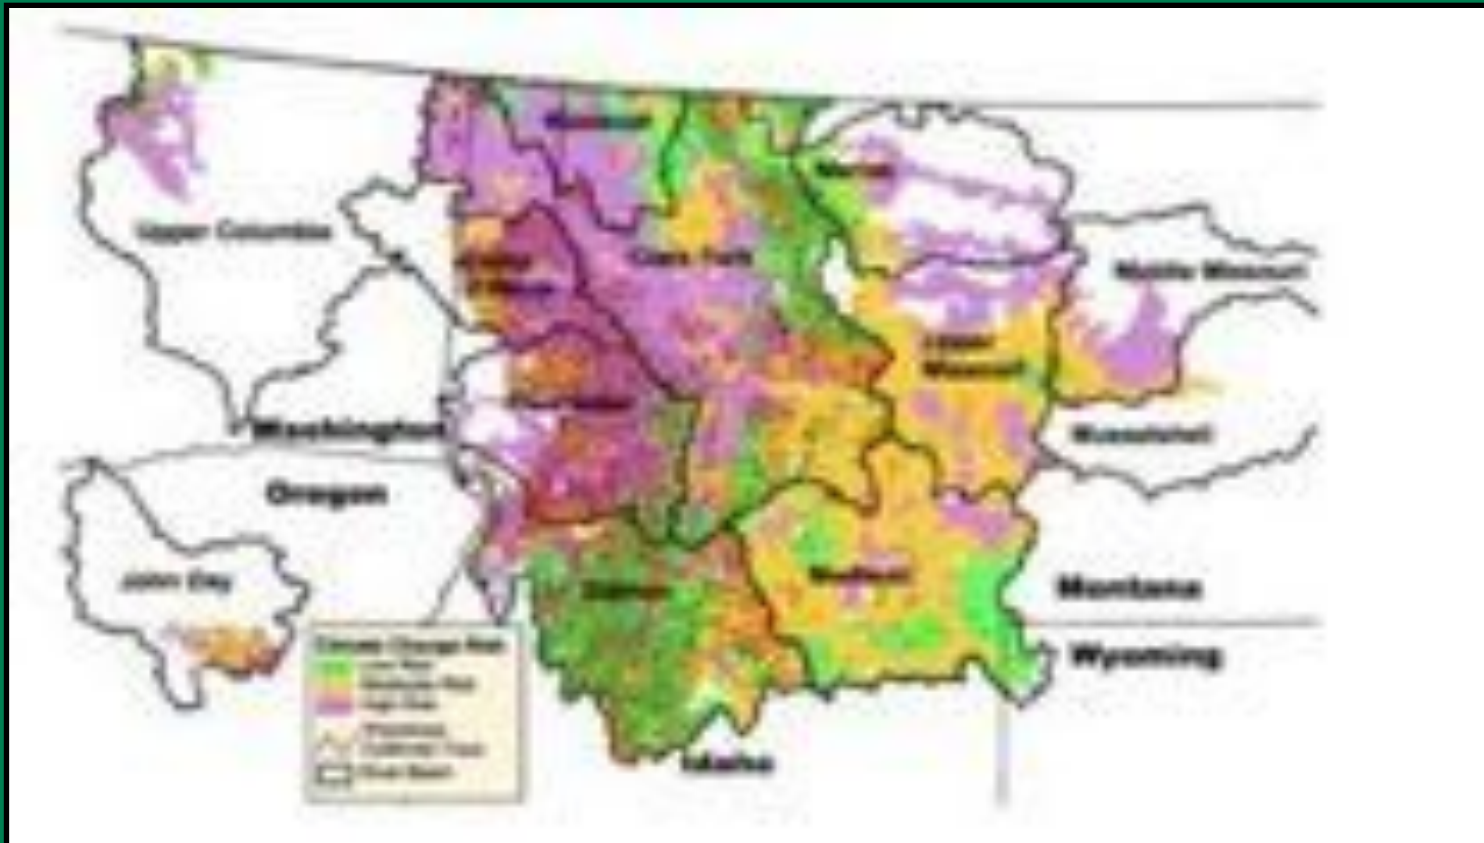

Williams et al. 2009

Risks vary substantially from one species or subspecies to the next

- 39% of Bonneville cutthroat habitat at high risk of fire
- 17% of Colorado River cutthroat habitat at high risk

Coarse-scale Evaluation

As much as 65% of the habitat currently occupied by WCT will be at high risk due to climate change (warmer water, winter flooding, and increased wildfires) over the next 50 years.....

Flathead

Logging Creek

Invasive Species

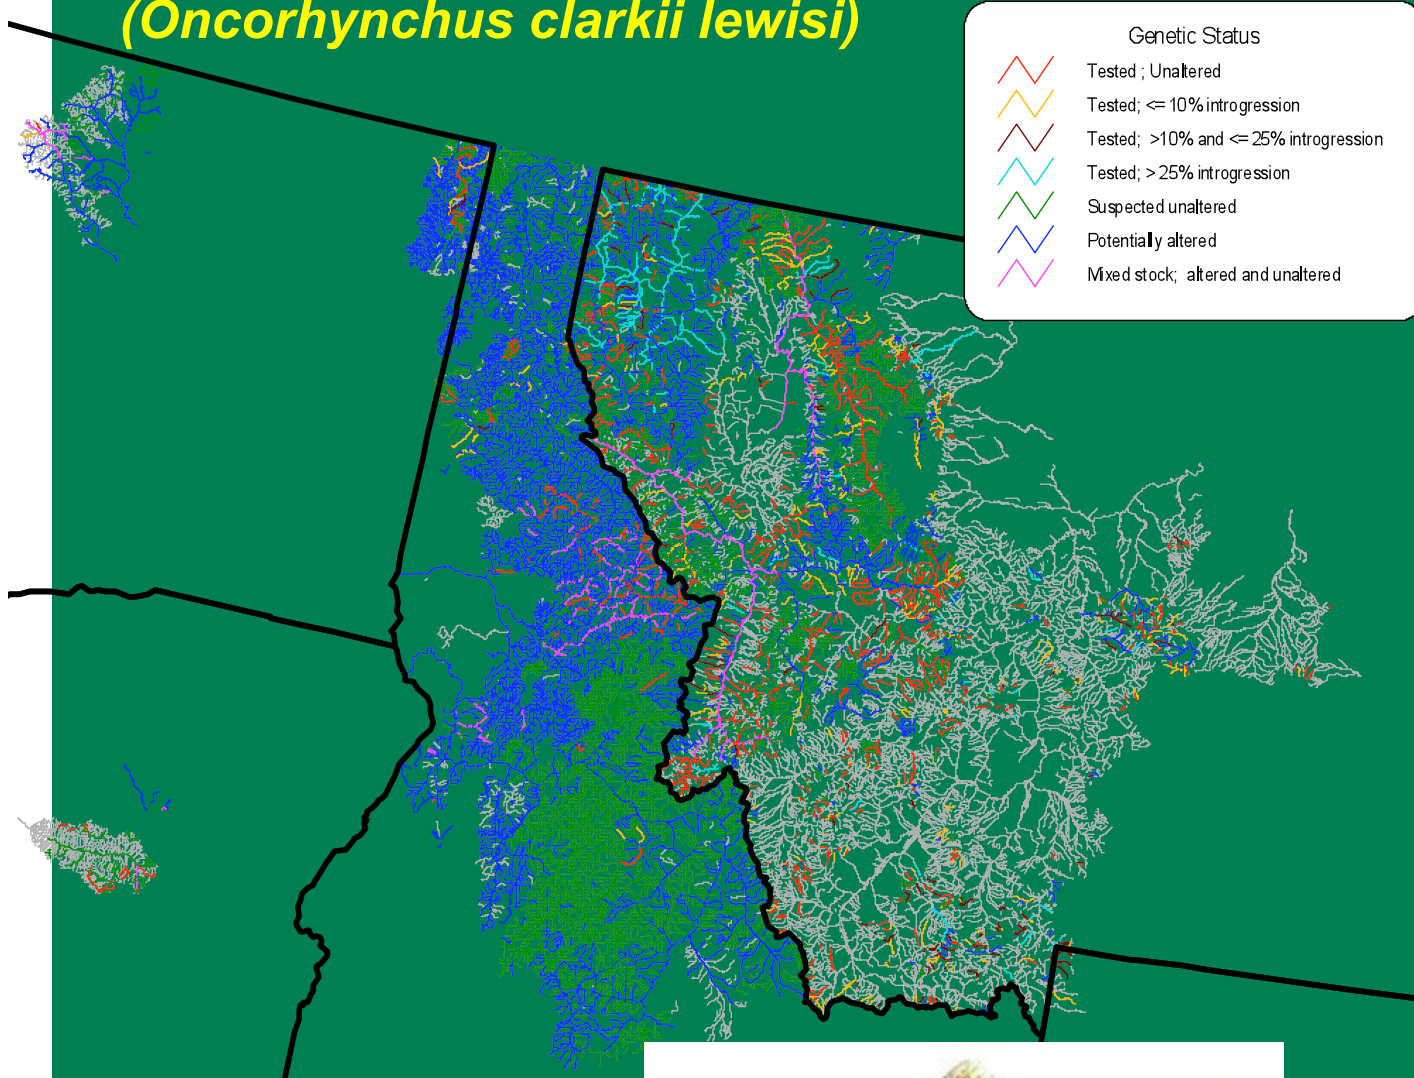

Hybridization

- Loss of co-adapted gene complexes and ecological adaptations
- Threatens the persistence of many rare and endangered species

Westslope Cutthroat Trout (*Oncorhynchus clarkii lewisi*)

- One of four major subspecies of cutthroat trout
- Distribution: Columbia, Fraser, Missouri, and Hudson Bay drainages of the US and Canada
- Non-hybridized (red) populations occupy <10% of their historic range in the USA
- Hybridization with introduced rainbow trout is the leading factor in their decline

USGS

Shepard et al. (2005)

1984

- Low levels of introgression in 2 of 14 sites (14%)

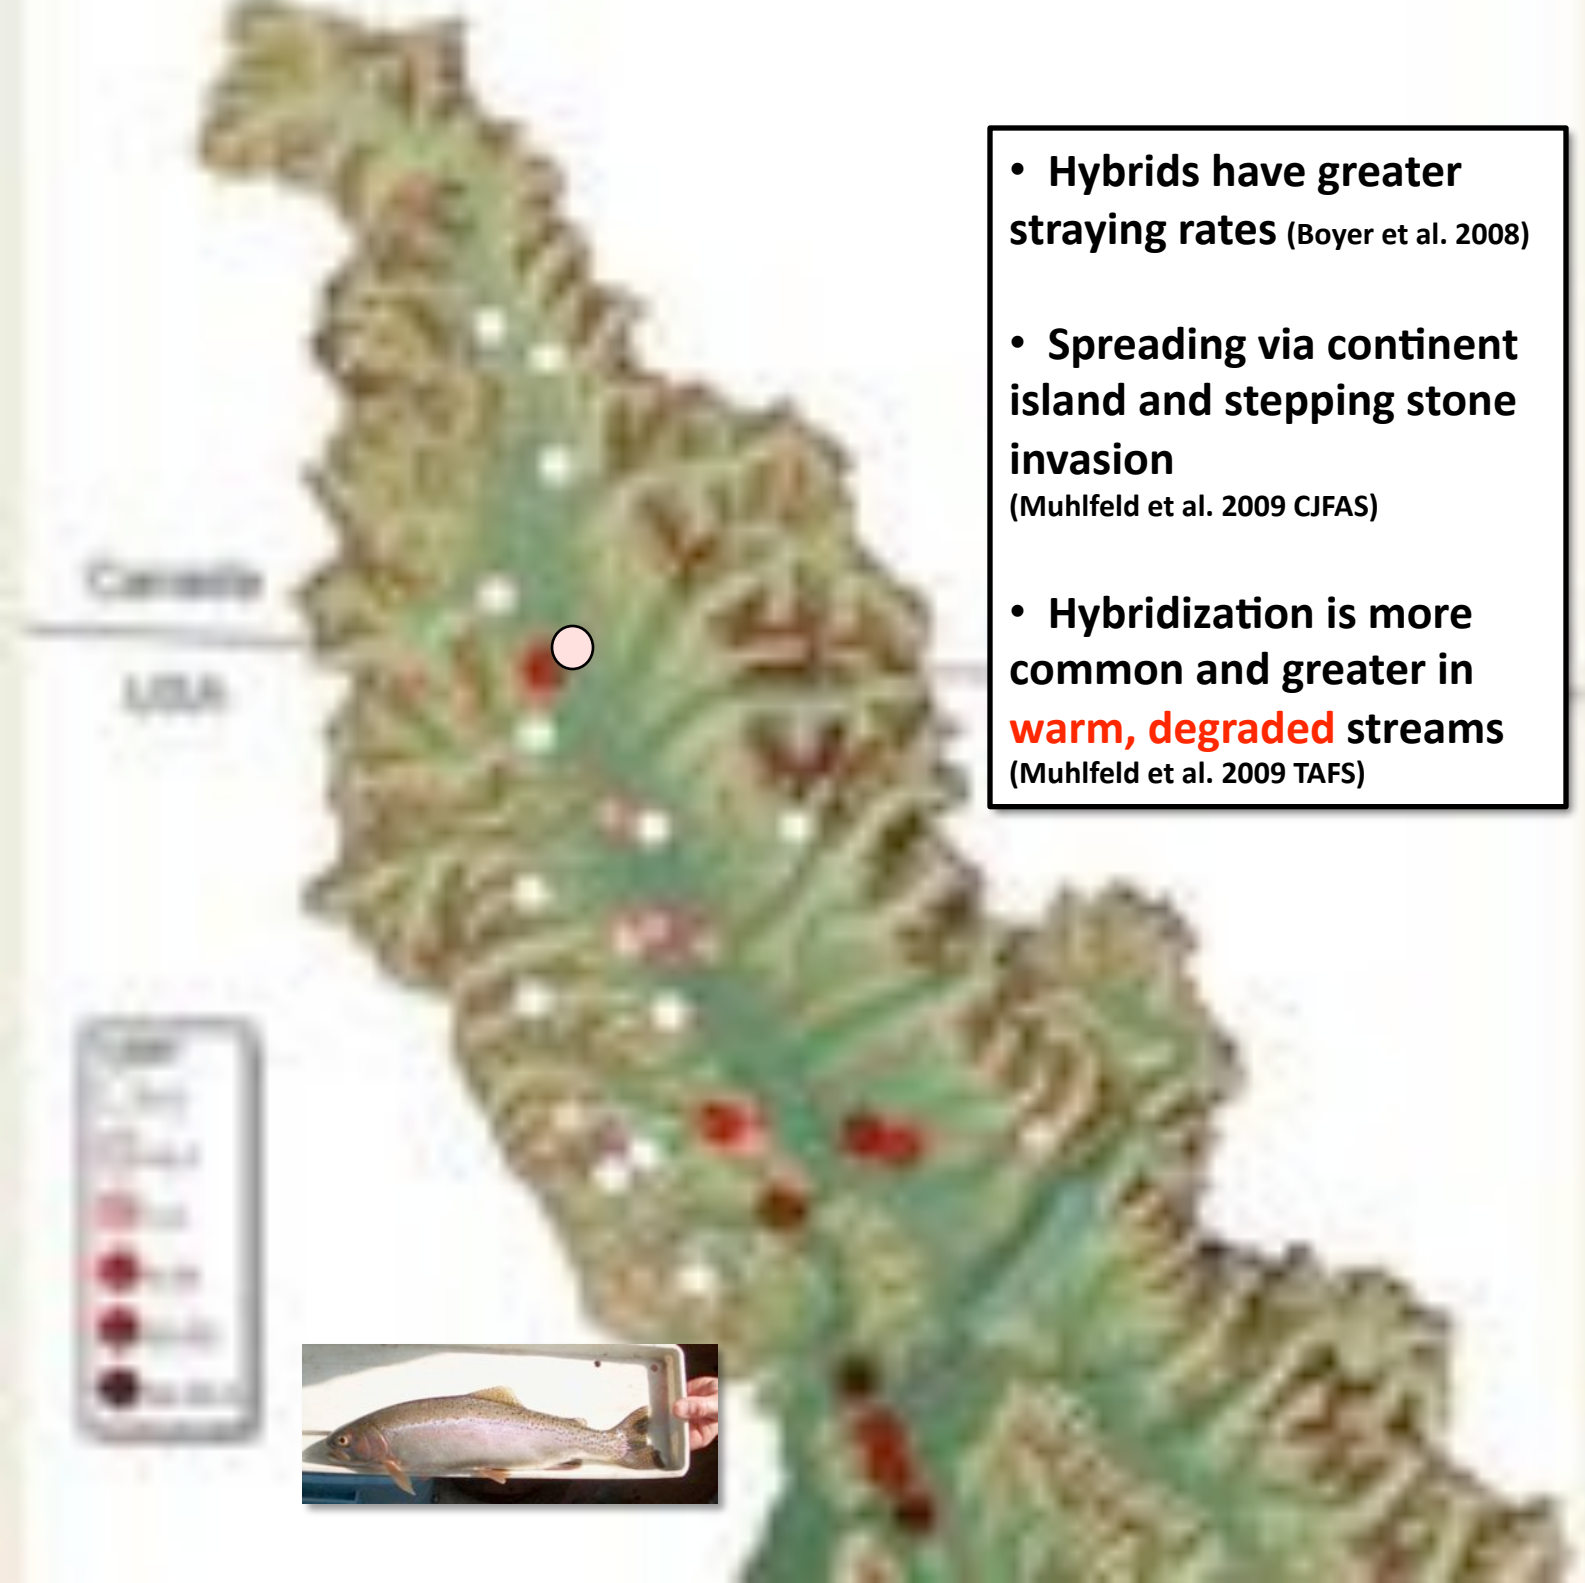

Hitt et al. (2003)

2002

- New introgression in 7 of 12 sites (58%)

Hitt et al. (2003) CJFAS

- Hybrids have greater straying rates (Boyer et al. 2008)
- Spreading via continent island and stepping stone invasion (Muhlfeld et al. 2009 CJFAS)
- Hybridization is more common and greater in **warm, degraded** streams (Muhlfeld et al. 2009 TAFS)

Hybridization Rapidly Reduces Fitness

Hybridization Changes Behavioral Characteristics

Muhlfeld et al. (2009) CJFAS

Model Results

Distribution

Logistic regression (AIC):

Variables	B	S.E.
Model 1		
Mean temperature	0.955	0.56
Distance to source	-0.103	0.043
Number of road crossings	0.128	0.086
Constant	-3.532	4.64
Model 2		
Mean temperature	1.104	0.584
Distance to source	-0.099	0.047
Constant	-4.131	4.518

Proportion Admixture

Linear regression (AIC):

Climate Change Impacts on Geomorphology and Associated Bull Trout Spawning Areas

Mitigating Impacts of a Warming Climate

Thermal and hydrological measures :

- Maintain/restore riparian integrity, **instream flows**, & manage distribution/intensity of human induced wildfires

Flathead River IFIM Study :

Mitigating Impacts of a Warming Climate

Biological measures:

- Barriers, assisted migrations/translocations
- Maintain diverse, productive habitats & populations
- Nonnative species control

Decision Support Tools for Managers

The background of the slide is a photograph of a stream. The water is clear and blue, flowing over dark, wet rocks. The scene is slightly blurred, giving a sense of movement and depth. The lighting is natural, suggesting an outdoor setting.

Need: Regional Assessment of Aquatic Species Vulnerabilities and Responses to Climate Change

Research and monitoring:

- Temperature (air and water) and flow monitoring
- Temperature and flow modeling at different scales and techniques
- Vulnerability assessments for native and nonnative aquatic biota and critical habitats, using an *ecosystem approach*
- Forecasting nonnative invasive species interactions
- Predicting impacts to landscape connectivity and genetic diversity
